

Table of Contents

Preface.....	iii
Table of Contents.....	xxxiii
0. Introduction: the broad picture	1
0.1 Complex space use from memory utilization.....	1
0.2 Spatially explicit patch selection in behavioural ecology	8
0.3 Optimal foraging in stochastic movement models	9
0.4 From individual space use to population kinetics	12
0.5 Reflection of individual space use at coarse scales.....	13
0.6 Challenging the mean field assumption.....	14
0.7 From mean field to multi-scaled dynamics	15
0.8 The statistical-mechanical approach	17
1. A large mystery in a little detail	21
1.1 The first glimpse.....	21
1.2 Pinpointing a feasible reason for ignorance: KDE.....	28
1.3 Leaving the comfort zone: confronting memory effects.....	31
1.4 The basics of studying individual space use	35
1.5 The home-range ghost.....	37
2. Basics of movement physics: the standard models.....	42
2.1 Transitions from deterministic to stochastic movement	42
2.2 From mechanistic to statistical-mechanical modelling.....	47
2.3 Behavioural ecology at the statistical-mechanical level	50
2.4 Markov compliance and the characteristic scale.....	53
2.5 Markov from another angle: the principle of superposition	54
2.6 Linearization of non-linear mechanistic interactions	56
2.7 The cross-scale homogenization assumption.....	64
2.8 From non-equilibrium to equilibrium	67
3. Approaching memory	73
3.1 Preparing to exterminate the home-range ghost	73
3.2 Spatial memory from a mechanistic premise	74
3.3 Coarse-graining the mechanistic memory model	78
3.4 Statistical-mechanical simulation of MemRW	80
3.4.1 Model simplifications and simulation methods.....	80
3.4.2 Simulation results.....	83
3.4.3 Conclusion	86

4. Movement physics beyond Markov compliance	87
4.1 System complexity.....	87
4.2 The memory aspect and resilience to model details.....	89
4.3 Site fidelity under continuous time random walk (CTRW)	90
5. Parallel processing: the concept.....	95
5.1 A heuristic introduction to multi-scaled random walk	95
5.2 Initial descriptions of the parallel-processing conjecture	98
5.3 Parallel processing in later publications	103
5.4 Why invoke the parallel-processing conjecture?.....	110
6. Modelling parallel processing.....	114
6.1 Inter-level model coherence and ergodicity	114
6.2 Population kinetics: premises for the classical approach	115
6.3 Classic population kinetics	118
6.4 Population kinetics under the parallel-processing premise	122
6.4.1 Structure of scale-free space use.....	122
6.4.2 Distribution of space use over a scale range	122
6.4.3 Emergence of a scale-free population dispersion	126
6.4.4 Mathematical formalism of parallel processing	127
6.4.5 Parallel-processing properties	129
6.4.6 Dispersion of kinetic energy over a scale range	133
6.4.7 Redefining statistical mechanics	135
6.5 Statistical properties of a parallel-processing system	136
6.5.1 Scale-specific versus scale-free spatial variance	137
6.5.2 South state hospitality.....	141
6.5.3 The Z-paradox.....	142
6.5.4 The density dilution issue of classical models.....	145
7. Parallel processing at the individual level.....	149
7.1 Testing inter-level model coherence	149
7.2 Simulating multi-scaled random walk (MRW).....	151
7.2.1 The non-mechanistic premise for spatio-temporal memory.....	151
7.2.2 The step-generating algorithm: scale-free movement	152
7.2.3 Adding site fidelity to a scale-free movement path	154
7.2.4 Simulating space use: the generic MRW model.....	155
7.2.5 The characteristic scale and the home-range ghost paradox	157
7.2.6 Fractal dimension of the spatial dispersion of fixes	158
7.2.7 Site fidelity and habitat selection	161

7.3 Model extensions.....	162
7.3.1 Strength of site fidelity.....	162
7.3.2 Constraining memory	162
7.4 The Lagrangian aspect of MRW.....	163
7.4.1 Step distribution functions	163
7.4.2 The distribution hump from site fidelity under MRW	166
7.4.3 Lagrangian and Eulerian system aspects	168
7.4.4 Truncation and mean free path.....	169
7.5 Distinguishing MRW from composite Brownian motion.....	169
7.5.1 What is composite Brownian motion?.....	169
7.5.2 Applying the parallel shift method to verify scale-free movement.....	171
7.5.3 Simulating multi-level composite Brownian motion	173
7.5.4 Simulating scale-free processes.....	174
7.5.5 Simulation results of scale-specific versus scale-free processes	175
7.6 Testing for parallel processing: red deer GPS fixes.....	180
7.7 Parallel shift and the statistical-mechanical approach	182
7.8 Effect from area constraint on model parameters	185
7.9 Density distribution of fixes.....	189
8 Movement classes at the statistical-mechanical level.....	193
8.1 Testing protocols for movement class compliance.....	193
8.2 The scaling cube	196
8.3 Parallel processing: planning for the future.....	203
8.4 Summary of individual-level test protocols.....	204
8.5 Path analysis and cross-scale complexity.....	205
9. Is parallel processing applicable to invertebrates?.....	208
9.1 Classifying path integration in insect movement	208
9.2 Exploring complex population kinetics in sycamore aphids.....	209
9.3 Sycamore aphid data	212
9.4 Hypotheses for local dispersion of aphids	215
9.4.1 Outline for the study.....	215
9.4.2 Method 1: the density distribution	215
9.4.3 Method 2: the variance-mean relationship.....	216
9.4.4 Method 3: testing for dominance of movement rate.....	216
9.5 Results	217
9.5.1 Local correlation of abundance.....	217
9.5.2 The density distribution.....	219

9.5.3 The variance-mean relationship	219
9.5.4 Testing for dominance of movement rate	221
9.6 Summary and concluding remarks	222
10 Intrinsic complexity: 1/f noise and the scaling paradox.....	224
10.1 Population availability over space and time	224
10.2 Chaos and self-organized criticality	226
10.3 Linking alternative descriptors of complexity	229
10.4 The power spectrum	230
10.4.1 Fourier transforms and reddened spectra	230
10.4.2 Flicker noise.....	232
10.4.3 Invoking a grain/window conjecture to quantify complex spectra	235
10.4.4 Complexity may require an extra Cartesian coordinate.....	238
10.4.5 Linking 1/f noise to the variance-mean relationship	240
10.4.6 Variability of intrinsic and extrinsic origin	242
10.5 Red noise of extrinsic origin	243
10.5.1 Local causality means a serial process.....	243
10.5.2 A serial process has a characteristic response rate	243
10.5.3 Flicker noise, ergodicity, and environmental stochasticity.....	247
10.6 Flicker noise in a time series: coffee leaf miner.....	247
11 Implications and applications	251
11.1 What does multi-scaled movement really mean?	251
11.2 Two variants of the standard model	252
11.3 Standard model variants: implications for applications?	256
11.4 Markovian, multi-scaled movement: the evidence?	257
11.5 Scrutinizing empirical support for mode-switching	258
11.6 Implications for theoretical ecology	264
11.7 Implications for applied ecology	265
12 Concluding remarks.....	271
References	275
Appendix A. Influence from fix sampling interval	290
A.1 Scale-specific movement process: from CorrBM to BM	290
A.2 Scale-free movement path: Lévy walk	291
A.3 Scale-free movement with site fidelity: MRW	292
Subject index	293
